

Burn Down Chart

Issue Record

Version	Date	Notes
0.1	19/5/21	Added burn down chart and short context paragraph
0.2	4/6/21	Update burndown chart and context paragraph
0.3	19/6/21	Updated burndown chart and context paragraph

Burn Down Chart

In the burn down chart you can see that during the first/second sprint I was ahead of schedule. However, transitioning into the third/fourth sprint left me slightly behind schedule. This is because when creating the user stories, having now completed some of them, I can see that many of the points given were bad estimations for the amount of time and effort it would take. Also, many of the user stories did not take into account some of the tasks/features that are associated with certain features. During the 5th sprint I managed to double the amount of completed user stories, and implement Docker fully. During the 6th sprint I managed to fully implement all 10 user stories, automate all user acceptance tests via cypress, mock all repositories in unit tests to ensure isolation and implement pushing images to docker hub into my pipeline.
